8.4.1.2

INTRODUCTIO.

Egregio operi *Burckhardiano* Parisiis a. 1817 edito, cui inscriptum est:
„Table des Diviseurs pour tous les nombres depuis
1 à 3036000”

inserta invenitur tabula, in qua pro omnibus numeris *primis* p inde a 2
 usque ad 2543 et deinde adhuc pro nonnullis aliis numeris primis assigna-
 tur magnitudo periodi fractionis decimalis, in quam ipsa $\frac{1}{p}$ evolvi potest.
 Quam tabulam propter insignem eius usum hic totam appono.

Grandeur de la période de la fraction décimale égale à $\frac{1}{p}$.

Numeri n , periodi magnitudinem indicantes, qui in hac tabula iuxta ipsos numeros primos p inveniuntur, sunt numeri minimi, pro quibus fit

$$10^n - 1$$

per numerum primum p divisibilis. Pro omnibus igitur ipsius p valoribus, pro quibus valor ipsius n est $p - 1$, habetur 10 ipsius p radix primitiva. Est igitur secundum tabulam Burckhardianam numerus 10 radix primitiva numerorum primorum sequentium:

I. Numeri primi, quorum 10 radix primitiva est.

Adscripti pro singulis centenis numerum numerorum primorum, quorum 10 radix primitiva est, et numerum totum numerorum primorum, reiectis 1, 2, 5. Patet ex hoc conspectu, praeter 1, 2, 5 dari 365 numeros primos usque ad 2500 atque inter eos haberi 148, quorum 10 sit radix primitiva.

In construendis tabulis, quibus pro singulis numeris primis numeri omnes positivi inferiores repraesentantur ut residua ex divisione potestatum

eiusdem numeri per numerum primum propositum resultantia, magna pars laboris versatur in indaganda aliqua radice primitiva seu numero illo qui pro *basi* potestatum accipi possit. Ex antecedentibus patet, pro 145 numeris primis e 365, qui habentur usque ad 2500, ei labori supersederi posse, quippe pro quibus iam constat radix primitiva eaque commodissima. Tabulae reciprocae, pro dato exponente potestatis radices primitivae residuum potestati congruum et vice versa exponentem potestatis dato numero congruae seu *indicem* dati numeri exhibentes, nuper ab ill. *Ostrogradsky* pro numeris primis minoribus quam 200 exstructae sunt. Quas mihi proposui propter immensam earum per totam arithmeticam utilitatem pro singulis numeris primis infra 1000 condere, quorum inter 200 et 1000 inveniuntur 122. Ex his gaudent 43, uti e tabula I patet, radice primitiva 10, unde tantum pro 79 ex eorum numero ut radicem primitivam indagarem restabat. E 199 numeris primis inter 1000 et 2500 sunt 88, quorum 10 radix primitiva est; unde inter hos limites pro 111 numeris primis radix primitiva indaganda restat. Qui tamen numeri adhuc minui possunt.

Sit p numerus primus $4m + 3$; quoties in tabula *Burckhardiana* valor ipsius n iuxta p positus est $\frac{p-1}{4}$, sive quoties $n = \frac{p-1}{4}$ est valor minimus ipsius n , pro quo fit

$$10^n = 1$$

per p divisibilis, erit -10 sive $p - 10$ radix primitiva ipsius p , quod ex elementis theoriae residuorum potestatum constat. Habemus igitur e tabula supra apposita hos numeros primos formae $4m + 3$, quorum -10 radix primitiva est.

II. Numeri primi $4m + 3$, quorum -10 est radix primitiva.

3. 31. 43. 67. 71. 83. 107. 151. 163. 191. 199. 227. 283. 307. 311. 347. 359. 431.
439. 443. 467. 479. 523. 563. 587. 599. 631. 683. 719. 787. 827. 839. 883. 911. 919. 947.
991.
1039. 1123. 1151. 1163. 1187. 1279. 1283. 1307. 1319. 1399. 1427. 1439. 1471. 1511. 1523.
1539. 1667. 1759. 1787. 1831. 1867. 1871. 1907. 1999. 2003. 2027. 2039. 2083. 2111. 2203.
2239. 2243. 2267. 2347. 2351. 2399.

Rursus igitur novimus 73 numerorum primorum infra 2500 radicem primitivam, unde numerus totus numerorum primorum infra 2500, pro quibus tabula *Burckhardiana* absque ullo ulteriore calculo radicem primitivam praebet, est

$$148 + 73 = 221;$$

usque ad limitem 2500 restant igitur tantum $365 - 221 = 144$ numeri primi, pro quibus radix primitiva indaganda est. Inter 200 et 1000, inter quos limites mihi ad tabulas novas condendas numeri primi considerandi erant, habentur 26, pro quibus -10 radix primitiva est, unde inter hos limites restant

$$122 - 43 - 26 = 122 - 69 = 53.$$

Inter 1000 et 2500 restant $199 - 88 - 36 = 75$, pro quibus radix primitiva indaganda est.

Ratio numerorum 73 et 148 nobis persuadere videtur, fieri ut, numericis primis usque ad limitem satis magnum consideratis, numerus omnium numerorum primorum, pro quibus 10 est radix primitiva, sit proxime duplus numeri numerorum primorum $4m+3$, pro quibus -10 radix primitiva est. Quoties 10 est radix primitiva numeri primi $4m+1$, eiusdem erit -10 radix primitiva et vice versa. Cuiusmodi numeri primi usque ad 2500 e tabula I habentur 76, unde existunt usque ad hunc limitem:

| | | |
|-----------------------|-----------------------------|-------------|
| numeri primi $4m+1$, | quorum ± 10 rad. prim., | 76 |
| " " $4m+3$, | " 10 " " , | 72 |
| " " $4m+3$, | " -10 " " , | 73. |

Quorum numerorum rationes crescentibus limitibus ad unitatem convergere facile conuicis. Unde etiam numeri primi, quorum $+10$ et quorum -10 radix primitiva est, eodem proxime numero crunt. Generalius conuicere licet, dummodo limites, inter quos numeri primi considerantur, satis ampli sint, proxime fieri, ut numeri primi, quorum datus numerus radix primitiva sit, pro omnibus datis numeris aequae multi existant.

At tabula *Burckhardi* non tantum pro $\frac{1}{p}$ circiter omnium numerorum primorum infra 2500 radicem primitivam assignat, sed radicem primitivam omnium commodissimam. Nam pro radice primitiva ± 10 multiplicationibus ad formanda potestatum residua superscedetur. Invento enim potestatis residuo, ut proxime altioris obtineatur, illi tantum zéro adscribendum erit et divisione per p facta residuum quacrendum, insuper signo mutato, si -10 est radix primitiva. Quare totum negotium inveniendi potestatum numeri 10 residua e divisione per datum numerum primum p

resultantia idem est atque evolutionis ipsius p in fractionem decimalem; eo tantum discrimine, ut in hoc negotio reiciantur residua, retineantur quotientes, in illo retineantur residua, reiciantur quotientes. Potest in negotio illo etiam ea multiplicatione supersederi, quam divisio per p poscit; nam cum quotientes omnes sint minores ipso 10, tantum opus est, ut multipla ipsius p per 1, 2, 3 ... 9 formentur, quorum numerorum proxime inferior a dividendo detrahatur, ut obtineatur residuum quaesitum. Unde totum negotium inveniendi residui potestatis proxime altioris ad unam subtractionem reducitur. Neque opus est, ut animum attendas, ad quemnam factorum 1, 2, 3 ... 9 pertineat numerus detrahendus, quia in his calculis quotientes omnino non euramus.

Nihilo tamen minus hunc calculi processum ego non secutus sum, sed alium praetuli, in quo etiam subtractione supersedemus et omni omnino calculo. Scribantur enim in *Columna Prima* omnes numeri ordine suo naturali inde a 1 usque ad $p - 1$; iuxta quos ponantur in *Columna Secunda* numeri 10, 20, 30, 40 cet., qui usque eo continuentur, dum pervenias ad numerum ipso p maiorem, in cuius locum, prout p est formae $10m + 1$, 3, 5, 7, 9, ponatur 9, 7, 5, 3, 1, ac deinde pergendum est iterata eiusdem numeri 10 additione, usque dum rursus pervenias ad numerum ipso p maiorem, in cuius locum rursus ponenda sunt illae aliquae unitates, quibus numerus ipsum p superat, et deinde rursus pergendum erit continua ipsius 10 additione, semper quoties ad numerum ipso p maiorem pervenias ipsius p detractioe facta. Quae eo usque continuanda sunt usque dum ad numerum $p - 10$ pervenias. Hac ratione altera columna et ipsa continebit omnes $p - 1$ numeros 1, 2, 3 ... $p - 1$ ita dispositos, ut iuxta quemlibet numerum k columnae I inveniatur in columna II residuum numeri $10k$ per p divisi. Utraque columna eadem celeritate atque facilitate formatur atque in numeris ordine naturali scribendis calamus currere valet. Neque ullo calculo post has columnas formatas opus est. E dato enim potestatis residuo r habes proxime altioris sumendo in Col. II numerum iuxta numerum r Columnae I positum. Quoties igitur 10 ipsius p radix primitiva est, nihil restat, nisi ut residua potestatum successivarum ipsius 10, hac ratione alia post alia inventa, tabulae inscribantur.

Si 10 radix primitiva est, nihil mutabitur, nisi quod Col. II a numero $p - 10$ ordiri debet eiusque numeri eodem numero 10 continuo

[b]

diminuendi sunt, simulac vero hac ratione ad negativum numerum perveneris, is numero p augendus est.

Sufficiet rem exemplis simplicissimis explicare. Sit $p=17$, cuius numeri primi e tabula *Burckhardiana* habetur 10 radix primitiva. Formatio tabulae hoc schemate absolvitur.

| 13 | 11 | 11 |
| 14 | 4 | 8 |
| 15 | 14 | 12 |
| 16 | 7 | 1. |

Sunt numeri in columna tertia positi residua potestatum, quarum exponentes seu *indices* ab ill. *Gauss* appellati in Col. I iuxta positi inveniuntur. Ad indicem 1 pertinet radix primitiva 10, iuxta 10 in Col. II invenitur 15, iuxta 15 invenitur 14, iuxta 14 invenitur 4 et ita porro. Hac ratione columna „*Numeri*” inscripta formata est. Fieri non potest ut error commissus lateat, cum numerus postremus fieri debeat 1.

Sit $p=31$, erit e tab. II eius radix primitiva — 10 sive 21; schema formandae tabulae residuorum potestatum ipsius 21 inserviens, hoc est:

I. II. *Numeri*

| | | |
|----|----|----|
| 1 | 21 | 21 |
| 2 | 11 | 7 |
| 3 | 1 | 23 |
| 4 | 22 | 18 |
| 5 | 12 | 6 |
| 6 | 2 | 2 |
| 7 | 23 | 11 |
| 8 | 13 | 14 |
| 9 | 3 | 15 |
| 10 | 24 | 5 |
| 11 | 14 | 12 |
| 12 | 4 | 4 |

His de iis numeris primis adnotatis, quorum $+10$ aut -10 radix primitiva est, pergimus ad reliquos. Etiam pro his tabula *Burckhardiana* non sine magno usu erit.

Sit p numerus primus $4m+1$, pro quo $n = \frac{p-1}{2}$, sive sit $\frac{1}{4}(p-1)$ valor minimus ipsius n , qui numerum

$$10^n - 1$$

per p divisibilem reddit. Formentur columnae I et II prorsus eadem ratione atque casibus, quibus 10 radix primitiva erat, unde dato quolibet numero infra p columna II suppeditabit *decupli* eius residuum. Cum sit 10 ipsius p residuum quadraticum, statuere licet

$$10 \equiv g^1 \pmod{p},$$

eritque et $+g$ et $-g$ radix primitiva ipsius p . Inveniuntur residua dignitatum ipsius g parium $g^2, g^4, \dots, g^{p-3}$ absque omni calculo per eandem methodum qua antecedentibus usus sum. Scilicet si a est residuum ipsius g^{2a} , quaeratur columnae I numerus a , et iuxta positus in columna II est residuum ipsius g^{2a+1} . Inventis hae ratione residuis omnibus dignitatum ipsius g parium, reliqui numeri infra p erunt residua dignitatum ipsius g imparium. Sit eiusmodi numerus b , quem statuere convenit minimum esse e numeris relictis; cuius quadratum vel quadrati residuum si est b' , invenitur b' inter residua dignitatum parium ipsius g , sive datur index ad quem b' pertinet. Qui index si est 2β , statuere licet, ipsum b pertinere ad indicem β , sive esse b residuum potestatis imparis g^β . Invenitur deinde residuum ipsius $g^{2\beta+1}$ sumendo in II numerum iuxta numerum b columnae I positum; si ille in col. I quaeritur, iuxta positus nume-

[b']

rus in col. II erit residuum ipsius $g^{2^{m+1}}$, et ita pergendo sine omni calculo invenis etiam omnium imparium ipsius g potestatum residua. Qua in operatione si ad ipsum g^r pervenitur, eius in locum ponendum est g , quae erit tabulae *basis*. Si placet residuorum dignitatum imparium scripturam — nam tantum scribendo opus est — ab ipso g inchoare, ita agere licet. Invenio indice β , sumatur e columna iam formata residuorum dignitatum parium residuum ipsius $g^{r-\beta}$, quod si est c , erit g residuum producti $b \times c$. Videmus, totum calculum faciendum consistere in formando quadrato b^2 eiusque residuo quaerendo, si $b^2 > p$, sed cum b semper perparvum, paucis unitatibus constantem, accipere liceat, etiam hic calculus nullus est.

E tabula *Burckhardi* inveniuntur 35 sequentes numeri primi $4m+1$ infra 2500, pro quibus 10 est congruum quadrato radices primitivae; pro quibus igitur formatio tabulae residuorum potestatum radices primitivae per praecepta antecedentia absolvitur.

III. Numeri primi $4m+1$, pro quibus 10 est quadrato radices primitivae congruum.

13. 89. 157. 197. 293. 373. 401. 409. 557. 569. 601. 653. 677. 761. 877. 881. 929.
1049. 1117. 1129. 1277. 1361. 1373. 1453. 1481. 1733. 1801. 1877. 1973. 1997. 2081. 2089.
2237. 2293. 2357.

Quibus absolutis, inter 200 — 1000 restant

$$122 - 43 = 26 - 13 = 122 - 82 = 40$$

numeri primi examinandi. Inter 1000 et 2500 restant $199 - 88 = 36 - 18 = 57$.

Schema tabulae formandae pro $p=13$ apponere sufficiat:

| I. | II. | A. | B. |
|----|-----|-------------------------------|---------------------------------|
| | | Residua potestatum
parium. | Residua potestatum
imparium. |
| 1 | 10 | | 6 |
| 2 | 7 | 10 | |
| 3 | 4 | | 8 |
| 4 | 1 | 9 | |
| 5 | 11 | | 2 |
| 6 | 8 | 12 | |
| 7 | 5 | | 7 |
| 8 | 2 | 3 | |
| 9 | 12 | | 5 |
| 10 | 9 | 4 | |
| 11 | 6 | | 11 |
| 12 | 3 | 1 | |

Praestat et parium et imparium potestatum residua in eadem columna exhibere, quae tantum ad monstrandam formationem se iunxi. Minimus numerus, qui in columna A non invenitur, est $2 = b$, cuius quadratum $b^2 = 4$ in col. A obveniens pertinet ad indicem, in col. I iuxta positum, $10 = 2\beta$, unde $\beta = 5$. Itaque iuxta numerum 5 columnae I pono in col. B numerum $b = 2$, a quo proficiscor. Ad numeros insequentes columnae B invenientes considero columnas I et II, in quibus iuxta 2 est 7, iuxta 7 est 5, iuxta 5 est 11, iuxta 11 est 6, iuxta 6 est 8, qui numeri 7, 5, 11, 6, 8, cum 2 ad arg. 5 pertineat, ad argumenta 7, 9, 11, 1, 3, 5 pertinebunt. Ut invento indice $\beta = 5$, statim g obtineam, sumo e A numerum ad indicem 13 — $5 = 8$ pertinentem, qui est $c = 3$, unde prodit $g = bc = 2 \times 3 = 6$.

Accedo ad reliquos numeros primos. Seligo c *Burckhardiana* tabula numeros primos $sm + 5$, pro quibus minimus ipsius n valor qui $10^s - 1$ per p divisibilem reddat, est

$$n = \frac{p-1}{4}.$$

Quibus modulis statutis, facile demonstratur esse -10 radices primitivae quadrato congruum, sive esse $\frac{p-1}{4}$ minimum ipsius n valorem, qui $(-10)^s - 1$ per p divisibilem reddat. Inveniuntur eiusmodi numeri primi infra 2500 sequentes 17.

IV. *Numeri primi $sm + 5$ infra 2500, pro quibus -10 est radices primitivae quadrato congruum.*

53. 173. 277. 317. 397. 773. 797. 853. 1013. 1093. 1493. 1613. 1637. 1693. 2213. 2333. 2477.

Itaque e numeris primis 365, qui praeter 2 et 5 infra 2500 inveniuntur, habentur tantummodo

$$365 - 148 - 73 - 35 - 17 = 92,$$

ideoque circiter pars quarta, respectu quorum ± 10 neque est radix primitiva neque radices primitivae quadrato congruum. Constructio tabulae pro numeris primis IV prorsus eodem modo absolvitur atque pro numeris primis praecedentibus III, nisi quod col. II eadem ratione formanda sit atque supra pro numeris primis, quorum -10 radix primitiva erat, ita ut numeri columnae II fiant residua numerorum iuxta positorum columnae I per -10 multiplicatorum. Quoties hac ratione formatur, vocabo in se-

quentibus columnam II *decrecentem*; alteram formam columnae II primum adhibitam, qua numeri crescentes exhibentur, semper tacite subintelligam, nisi contrarium adnotetur. Restant inter 200 et 1000 n. pr. $40 - 6 = 34$, inter 1000 et 2500 n. pr. $37 - 9 = 48$.

Seligo numeros primos, pro quibus $n = \frac{p-1}{3}$ est valor ipsius n minimus, qui numerum $10^p - 1$ per p divisibilem efficiat, sive pro quibus 10 est congruus eubo radices primitivae. Quorum infra 2500 e tab. *Burckh.* habentur 22 sequentes:

V. *Numeri primi infra 2500, pro quibus 10 est radices primitivae eubo congruus.*

103. 127. 139. 331. 349. 421. 457. 463. 607. 661. 673. 691. 739. 829. 967.

1657. 1669. 1699. 1753. 2011. 2131. 2287.

Sit g radix primitiva, cuius cubus ipsi 10 congruus est, erunt etiam $g^{1+\frac{p-1}{3}}$, $g^{1+\frac{2(p-1)}{3}}$ radices congruentiae $x^3 \equiv 10$. Si $p-1$ per 9 divisibilis, erunt et hae ipsius p radices primitivae, cum $1 + \frac{p-1}{3}$, $1 + \frac{2(p-1)}{3}$ ad $\frac{p-1}{3}$ ideoque et ad 3 et ad $\frac{p-1}{9}$ primi sint, unde etiam ad $3^3 \cdot \frac{p-1}{9} = p-1$. Si $p-1$ non est per 9 divisibilis, erit sive $1 + \frac{p-1}{3}$ sive $1 + \frac{2(p-1)}{3}$ per 3 divisibilis ideoque e duobus numeris $g^{1+\frac{p-1}{3}}$, $g^{1+\frac{2(p-1)}{3}}$ alter quoque ipsius p radix primitiva erit, alter non erit. Unde prout $p-1$ per 9 divisibilis aut non divisibilis est, congruentiae $x^3 \equiv 10$ aut omnes tres radices aut duae tantum erunt radices primitivae ipsius p .

Formatis columnis I et II per eandem methodum, qua in antecedentibus semper usus sum, obtinentur e residuo 10 $\equiv g^3$ alia post alia sine ullo calculo residua potestatum $g^1, g^2 \dots g^{p-2}$, quae constituunt residuorum primam classem. Sit b numerus, qui in prima classe non invenitur; unde, si $b \equiv g^m$, erit m non per 3 divisibilis. Sit porro b' cubi ipsius b residuum minimum positivum, inveniri debet b' inter residua primae classis, eique index 3β respondebit, sive erit

$$b' \equiv g^{3\beta};$$

unde m aut β aut $\beta + \frac{p-1}{3}$ aut $\beta + \frac{2(p-1)}{3}$. Si $p-1$ per 9 divisibilis est, hos tres valores ipsi m perinde assignare licet; si vero $p-1$ per 9 non divisibilis est, e tribus numeris β , $\beta + \frac{p-1}{3}$, $\beta + \frac{2(p-1)}{3}$ unus per 3 divisibilis reliquendus est; reliqui duo perinde pro ipso m accipi possunt. Priore casu tres valores ipsius m , posteriore duo valores respondent tri-

bus aut duabus radicibus congruentiae $x^3 \equiv 10$, quae ut radices primitivae locum tencere possunt ipsius g sive *basis* tabulae.

Invento ipsius m valore rursus per continuum transitum ex altera columnarum I et II ad alteram statim habentur ipsarum g^{n+1} , g^{n+2} , cet. g^{n-1} residua, ubi rursus loco g^r sive g^{r+1} scriptum est g sive g^1 . Quae residua constituunt *secundam* classem. Si $m \equiv 1 \pmod{3}$, in hac classe *basis* tabulae invenitur g ; cuius quadratae residuum suppeditat numerum ad indicem 2 pertinentem, de quo deducuntur ope coll. I et II numeri ad indices $s, s \dots p-2$ pertinentes sive residua potestatum $g^3, g^4 \dots g^{p-2}$. Quae constituunt residuorum *tertiam* classem, iamque residua omnium potestatum radices primitivae inventa sunt. Si $p-1$ per 9 non divisibilis est, semper supponere licet $m \equiv 1 \pmod{3}$, nam e duobus ipsius m valoribus alter erit $\equiv +1$ alter $\equiv -1 \pmod{3}$. Si vero $p-1$ per 9 divisibilis est, erunt tres ipsius m valores $\beta, \beta + \frac{p-1}{3}, \beta + \frac{2(p-1)}{3}$ respectu moduli 3 inter se congrui. Quo casu si evenit ut habeatur $m \equiv 2 \pmod{3}$, non invenitur ipsa basis g sed ipsius g^2 residuum in *secunda* classi residuorum; in eadem classi cum etiam inveniatur residuum ipsius g^{p-2} , utroque multiplicato invenitur ipsius g^r residuum sive basis g . E qua deinde deducitur ope coll. I et II tertia classis residua potestatum $g, g^4 \dots g^{p-3}$ continens.

Numerus b cum semper valde exiguus accipi possit, ipse b^1 sine ullo negotio invenitur; computus peragendus — si computum dicere vis — unice consistit in quadrando residuo aut multiplicatione duorum residuorum et quaerendo quadrati aut producti residuo.

Pro $p = 103$ cx. gr. est 2 minimus numerus qui in classi prima non invenitur, unde $b^1 = 5$; porro fit $3\beta = 36$, $\beta = 12$, $\beta + 34 = 46$, $\beta + 68 = 70$; eligatur valor $m = 46$, qui est $\equiv 1 \pmod{3}$; in classe *secunda*, de hoc ipsius m valore deducta, invenitur $g = 6$, unde $g^2 = 36$.

Pro $p = 127$ est $p-1$ per 9 divisibilis; eo casu fit $b = 3$ minimus numerus qui in classe prima non invenitur, unde $b^1 = 27$; porro fit $3\beta = 69$, $m = \beta = 23$, qui numerus est $\equiv 2 \pmod{3}$; in classe *secunda*, de hoc valore ipsius m deducta, reperitur $g^2 \equiv 70$ simulque invenitur $g^{p-2} \equiv g^{125} \equiv 7$; residuum producti $7 \times 70 = 490$ est 109, quae est basis tabulae g , de qua inventa deducitur tertia classis.

Si immediate, simulac ipsius m valor inventus est, quaeritur g sive g^2 , multiplicetur, si $m \equiv 1 \pmod{3}$, numerus b per residuum po-

testatis g^{r-m} , quod in classe prima invenitur, producti residuum erit basis g ; si $m \equiv 2 \pmod{3}$, multiplicetur b per residuum potestatis g^{r+m-2} , quod eo casu in classe prima invenitur, producti residuum pertinebit ad indicem 2 sive erit ipsi g^2 congruum. Ut inveniat immediate ipsa basis, si $m \equiv 2 \pmod{3}$, poterit residuum ipsius b^2 per residuum ipsius g^{r-m} in classe prima obveniens multiplicari, eritque residuum basis g .

Absolutis numeris primis V restant inter 200 et 1000 adhuc $34 - 12 = 22$, inter 1000 et 2500 adhuc $48 - 7 = 41$.

Seligo iam numeros primos p formae $4m + 3$, pro quibus minimus numerus n , qui reddat $10^n - 1$ per p divisibilem, sit $n = \frac{p-1}{4}$; erit pro his -10 cubo radices primitivae congruum. E tab. *Burckh.* infra 2500 eiusmodi inveniuntur numeri primi 11:

VI. Numeri primi formae $12m + 7$ infra 2500, pro quibus -10 cubo radices primitivae congruum.

79. 547. 643. 751. 907. 1483. 1627. 1723. 1747. 1879. 1987.

Pro his numeris primis eadem est constructio tabulae atque pro praecedentibus V, nisi quod *decrescens* columna II formanda est. Restant inter 200 et 1000 adhuc $22 - 4 = 18$ numeri primi, inter 1000 et 2500 adhuc $41 - 6 = 35$. Quo facilius in conspectum veniat, quibusnam potestatibus radices primitivae statui possint numeri ± 10 respectu horum numerorum primorum congrui, refingam tabulam *Burckhardianam*, eiectionis numeris primis, quos iam in antecedentibus consideravi.

$p.$ 11. 37. 41. 73. 101. 137. 211. 239. 241. 251. 271. 281. 353. 449. 521. 613. 617. 641.

 $r.$ 12. 28. 4. 4. 33. 6. 4. 10. 5. 6. 30. 6. 6. 14. 24.

$p.$ 1409. 1423. 1451. 1459. 1489. 1499. 1597. 1601. 1609. 1721. 1889. 1901. 1931. 1933.
 $n.$ 32. 153. 290. 162. 248. 214. 266. 200. 201. 430. 118. 380. 386. 21.
 $r.$ 44. 9. 5. 9. 6. 7. 6. 8. 8. 4. 16. 5. 92.

$p.$ 1951. 2053. 2087. 2129. 2161. 2281. 2311. 2377. 2381. 2393. 2441. 2467.
 $n.$ 390. 342. 298. 532. 30. 228. 462. 264. 476. 184. 305. 137.
 $r.$ 5. 6. 7. 4. 72. 10. 5. 9. 5. 13. 8. 18.

In hac tabula, in qua $nn' = p - 1$, omnes numeri primi desunt, pro quibus $n' = 1, 2, 3, 4$; desunt insuper numeri primi $4m + 3$, pro quibus $n' = 6$ atque numeri primi $8m + 5$, pro quibus $n' = 4$, quos iam praecedentibus consideravi. Est rursus n numerus minimus, pro quo habeatur

$$10^n \equiv 1 \pmod{p},$$

sive est 10 radix primitiva congruentiae $x^n \equiv 1$, unde ponere licet

$$10 \equiv g^n \pmod{p},$$

designante g ipsius p radicem primitivam. Si n impar est, fit congruentia $10^n \equiv 1$ eadem atque $(-10)^n \equiv -1$, unde erit etiam n minimus numerus, pro quo habeatur $(-10)^n \equiv -1$, sive erit etiam -10 radix primitiva congruentiae $x^n \equiv -1$. Unde, cum -1 potestati $\frac{p-1}{2}$ radices primitivae congruum sit, ponere licet, si n impar est,

$$-10 \equiv g'^{\frac{p-1}{2n}} \equiv g'^{\frac{1}{2}n'} \pmod{p},$$

designante g' ipsius p radicem primitivam.

Iam tabulam praecedentem secundum valores ipsius n' disponam hoc modo:

- $10 \equiv g^4 \pmod{769, 809, 1009, 1721, 2129}$
- $-10 \equiv g^4 \pmod{41, 1609, 2441}$
- $10 \equiv g^3 \pmod{11, 251, 1061, 1451, 1901, 1931, 1951, 2111, 2381}$
- $-10 \equiv g^4 \pmod{1031}$
- $10 \equiv g^6 \pmod{597, 1201, 1237, 1249, 1489, 1597, 2051}$
- $-10 \equiv g^6 \pmod{37, 613, 733}$
- $10 \equiv g^7 \pmod{211, 617, 1499, 2087}$
- $10 \equiv g^8 \pmod{241, 1601}$
- $10 \equiv g^9 \pmod{73, 1423, 1459, 2177}$
- $-10 \equiv g^9 \pmod{2467}$
- $10 \equiv g^{10} \pmod{281, 521, 2281}$
- $10 \equiv g^{11} \pmod{353}, -10 \equiv g^{11} \pmod{1321}, 10 \equiv g^{13} \pmod{2393}$
- $10 \equiv g^{14} \pmod{449, 1289}, -10 \equiv g^{14} \pmod{757}$
- $10 \equiv g^{15} \pmod{137}, -10 \equiv g^{15} \pmod{1231}, 10 \equiv g^{16} \pmod{1889}$
- $-10 \equiv g^{17} \pmod{219}, 10 \equiv g^{20} \pmod{641}, 10 \equiv g^{22} \pmod{101}$

[c]

$$\begin{aligned} -10 &\equiv g^{27} \pmod{271}, & 10 &\equiv g^{33} \pmod{359}, & 10 &\equiv g^{44} \pmod{1409} \\ -10 &\equiv g^{46} \pmod{1933}, & 10 &\equiv g^{78} \pmod{2161}. \end{aligned}$$

Non ego pro singulis istis exponentibus ipsius g seu *indicibus*, qui numero $+10$ aut -10 respondent, regulas particulares condam, sed iam tradam methodum generalem, qua commodissime tabulae construuntur, quibus pro *quolibet* dato modulo primo p numeri omnes $1, 2, 3 \dots p-1$ exhibentur ut diversarum numeri alicuius potestatum residua. Qui numerus vocatur *basis* tabulae.

Methodus generalis pro modulo primo p numeros $1, 2, 3 \dots p-1$ exhibendi ut diversarum numeri alicuius potestatum residua.

Sumatur ex arbitrio numerus parvus, facile addendus, ut $2, 3$ cet. vel 10 vel qui alius placet, positivus a vel etiam negativus $-a$. Formetur *columna* I numerorum naturalium $1, 2, 3 \dots p-1$. Deinde iuxta ponatur, si positivus electus est numerus a , *columna* II numerorum $a, 2a, 3a$ cet., qui ab ipso a incipiunt et continuo ipso a augentur, detracto p , simulac numerus ultra p crescit. Si electus est numerus negativus a , formetur col. II, quam *decreascentem* voco, numerorum $p-a, p-2a, p-3a, \dots$ qui ab ipso $p-a$ incipiunt et continuo ipso a diminuantur, addito p , simulac ad numerum negativum pervenitur. Nisi contrarium adnotetur, subintelligam, numerum positivum electum esse ideoque *columnam* II esse *crescentem*; negativo numero electo, *columnam* II *decreascentem* formandam esse, pressis verbis adiciam. Si $a=2$, semel tantum ipse p in formanda col. II detrahendus vel addendus crit, si $a=3$, bis etc. Formatis *columnis* I et II, invenitur iuxta quodlibet argumentorum $1, 2, 3 \dots p-1$, a^{pot} eius residuum minimum positivum. Si $a=2$, inveniuntur iuxta $1, 2 \dots \frac{p-1}{2}$ numeri pares $2, 4 \dots p-1$; iuxta $\frac{p+1}{2}, \frac{p+3}{2} \dots p-1$ numeri impares $1, 3 \dots p-2$. Ac generaliter constabit *columna* II ex a seriebus arithmeticis sive crescentibus sive decreascentibus, in quibus singulis est eadem differentia $\pm a$ atque primus terminus inter 0 et $a+1$, postremus inter $p-a-1$ et p positus est vel vice versa.

Si pro numero satis magno valorum ipsius p eundem retines numerum a , convenit *columnarum* I et II formationem *typis* exequi. Quod quomodo commode fiat, exemplo simplicissimo illustrabo. Sit $a=2$, ac

pro numero primo p typotheta in cistis suis fixas habeat duas columnas I et II, quales imprimi debent, utramque verticalem et alteram iuxta alteram positam, vel etiam, si melius convenit, utramque horizontalem, ita ut infra quemlibet numerum columnae I sit numerus respondens columnae II. His columnis impressis, ut obtineantur columnae pertinentes ad numerum primum proximum $p + 2\Delta$, ubi Δ plerumque valde parvus est, dirimat typotheta columnam II in duas partes, quarum primae, typis $2, 4, \dots p-1$ constanti, addat typos $p+1, p+3, \dots p+2\Delta-1$; secundae, typis $1, 3, \dots p-2$ constanti, typos $p, p+2, \dots p+\Delta-2$; denique columnae I addat typos $p, p+1, p+2, \dots p+\Delta-1$. Iunctis rursus columnae II partibus, typi imprimantur, ac deinde simili modo pergat typotheta ad formandas coll. I et II, ad numerum primum proxime maiorem pertinentes, rursus paucos typos adiungendo in fine columnae I, in fine et medio columnae II. Si columnae II *decrecentes* formandae sunt, columnae II addendi sunt *ab initio* typi $p+\Delta-2, p+\Delta-4, \dots p$ eique inter typos 1 et $p-1$ inserendi typi $p+\Delta-1, p+\Delta-3, \dots p+1$; denique rursus columna I ad finem adiungendi typi $p, p+1, \dots p+\Delta-1$. Simili modo agendum est pro dato alio quocunque numero a , si a numero primo p ad numerum primum $p+a\Delta$ pergis; videlicet in columna II singulis a locis diversis Δ typi addendi sunt, atque columnae I ad finem totidem adiciendi typi $p, p+1, p+2 \dots p+a\Delta-1$. Sic columnae formantur aliae post alias pro omnibus numeris primis, qui per a divisi idem residuum relinquunt; unde negotium in tot dividitur, quot sunt residua minima quae numeri primi per a divisi relinquunt, quorum idem est numerus atque numerorum ipso a minorum et ad a primorum. Pro singulis incipiendum est a numero primo minimo e propositis qui per a divisus datum residuum relinquit. Poterit etiam a numero primo, pro quo iam formatae sunt columnae, ad alium pergi, qui ab eo non differt multiplo ipsius a , si praeter addendos typos singulae columnae II partes a typotheta inter se commutantur, quod sine magno negotio efficitur.

Columnis I et II pro dato numero primo p quocunque modo formatis et iuxta positis, formetur columna A secundum hanc regulam, ut sumto numero columnae A in columna I sit iuxta positus in columna II numerus columnae A proxime insequens. Hinc si columnam formandam inchoamus a numero a , ex ordine ea continebit residua statum ipsius

[c*]

a primae, secundae, tertiae cet. Columna eo usque continuanda est, dum ad *unitatem* perveniat; quae si n^{m} numerus columnae est, notum est esse n factorem ipsius $p-1$, simulque erit n numerus *minimus*, pro quo habeatur $a' \equiv 1 \pmod{p}$, sive erit a radix primitiva congruentiae $x' \equiv 1 \pmod{p}$. Unde sequitur, posito $n' = \frac{p-1}{n}$ ac denotante g radicem primitivam congruentiae $x' \equiv 1 \pmod{p}$, fieri g *radicem primitivam* ipsius p . Quae simul accipi poterit pro *basi tabulae*.

Saepe eveniet, ut habeatur $n = p-1$, sive ut sit a ipsa radix primitiva, quae pro basi tabulae g accipiat. Eo casu columna A ipsam tabulam I suppleat sive *tabulam numerorum*, in qua inveniuntur residua omnium radicum primitivae potestatum, primae, secundae, tertiae usque ad $(p-1)^{\text{m}}$, cuius residuum ipsi unitati aequale fit. Argumenta huius tabulae sunt exponentes seu *indices* 1, 2, 3 .. $p-1$, sive erit numerus tabulae r_i argumento i respondens talis ut habeatur

$$g^i \equiv r_i \pmod{p}.$$

Numeri r_i omnes inter se diversi sunt, unde in tabula inveniri debent omnes numeri 1, 2 .. $p-1$ neque idem bis.

Deinde, ut pro quolibet dato residuo statim etiam vice versa habeatur *index* sive exponens potestatis, ipsi residuo congruae, formetur tabula II sive *tabula indicum*, cuius argumenta sint numeri 1, 2, 3 .. $p-1$, et cui inscribantur iidem numeri 1, 2 .. $p-1$ iis locis, qui respective argumentis $r_1, r_2 \dots r_{p-1}$ respondent. Itaque in tab. I pro *indicibus* argumentis inveniuntur *residua*, in tab. II pro *residuis* argumentis inveniuntur *indices*. Tabulae II formatio simul verificationem egregiam tabulae I offert; nam si per calami lapsum tabulae I numerus erroneus inscriptus est, idem numerus in tabula illa bis adest, unde obvieniunt duo numeri diversi eidem loco tabulae II inscribendi. Sit ex. gr. in tab. I pro argumentis i et k idem numerus scriptus sive per errorem factus $r_i = r_k$; inscripto numero i in eum locum tabulae II qui argumento r_i respondet, si numerum k inscribere vis in locum argumento r_k respondentem, iam eum locum occupatum invenies.

Paucis attingam *probabilitatem*, numerum ex arbitrio sumtum esse dati numeri primi radicem primitivam. Sunt numeri primi p totidem ra-

dices primitivae atque numeri ipso $p-1$ minores et ad ipsum $p-1$ primi. Unde si $f, f', f'' \dots$ sunt ipsius $p-1$ divisores primi, habentur

$$(p-1) \left(1 - \frac{1}{f}\right) \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots$$

radices primitivae ipsius p , siquidem, ut semper, consideramus tantum radices primitivas respectu moduli p inter se incongruas. Hinc, *designantibus* $f, f', f'' \dots$ ipsius $p-1$ divisores primos, erit fractio

$$\left(1 - \frac{1}{f}\right) \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots$$

probabilitas, datum numerum a esse ipsius p radicem primitivam. Unum numerorum $f, f', f'' \dots$ ponere licet $= 2$, unde designantibus $f', f'' \dots$ ipsius $p-1$ divisores primos *impares*, erit probabilitas illa,

$$\frac{1}{2} \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots$$

Si pro dato numero primo p numeri a libera est electio, per legem reciprocity in theoria residuorum quadraticorum fundamentalem eum numerum facillime ita eligis, ut sit ipsius p *non-residuum quadraticum*. Non-residuorum quadraticorum numerus cum sit $\frac{p-1}{2}$, probabilitas, unum ex eorum numero pertinere ad radices primitivas, quarum est numerus

$$(p-1) \left(1 - \frac{1}{f}\right) \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots,$$

erit

$$2 \left(1 - \frac{1}{f}\right) \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots = \left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots,$$

sive *designantibus* $f', f'' \dots$ ipsius $p-1$ divisores primos *impares*, probabilitas, datum numerum a non-residuum quadraticum esse radicem primitivam, erit

$$\left(1 - \frac{1}{f'}\right) \left(1 - \frac{1}{f''}\right) \dots$$

Unde eligendo in locum ipsius a non residuum quadraticum, duplicatur probabilitas, esse a radicem primitivam. Sunt infra 2500 praeter 2 et 5 numeri primi 365, sed numeri primi, quorum 10 est non-residuum quadraticum, tantum

$$148 + 22 + 9 + 4 + 4 + 4 + 1 + 1 + 1 + 1 + 1 = 192,$$

qui inveniuntur e tabulis supra exhibitis, seligendo casus, quibus posito $g^{n'} \equiv 10 \pmod{p}$ est n' impar. Singuli termini aggregati ipsi 192 aequalis respondent valoribus $n' = 1, 3, 5, 7, 9, 11, 13, 15, 25, 33$. Hinc, cum sint e supra traditis 148 numeri primi infra 2500, quorum 10 radix primitiva est, videmus, si omnes consideramus numeros primos infra 2500, probabilitatem, esse 10 radicem primitivam, fieri

$$\frac{148}{365} = \frac{2}{5} \cdot \frac{74}{73};$$

si vero consideramus solos numeros primos infra 2500, quorum 10 non residuum quadraticum est,

$$\frac{148}{192} = \frac{7}{9} \cdot \frac{21\frac{1}{2}}{21\frac{1}{2}},$$

quae fere est *dupla* antecedentis. Si $\frac{p-1}{2}$ et ipse est numerus primus aut binarii potestas, habebis *certitudinem*, ipsius p non-residuum quadraticum quodcunque, diversum a -1 , esse radicem primitivam. Si $\frac{p-1}{2}$ aequalis est numero primo multiplicato per ipsius 2 potestatem 2^s , neque pro dato non-residuo quadratico a habetur

$$a^{2^s} \equiv -1 \pmod{p},$$

certo erit a radix primitiva. Casu quo $p-1$ per 3 divisibilis est, probabilitatem, a esse radicem primitivam, adhuc augere licet, scilicet per $\frac{1}{3}$ multiplicari, si evitantur ipsius a valores, qui sunt ipsius p residua cubica. Cuius rei criteria pro $a = 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37$ in *secundo* Volume *Diarii Crelliani* pg.68 olim prodidi. Commode ex. gr. eligetur valor $a = 2$, dummodo numerus primus p non valore gaudeat formae $AA + 27BB$; aliorum enim omnium erit non-residuum cubicum. Infra 2500 inveniuntur numeri primi, quorum 10 neque residuum quadraticum neque residuum cubicum est, eiectis e numeris primis, quorum 10 non-residuum quadraticum est, insuper iis, pro quibus habetur $10 \equiv g^2, g^3, g^{11}, g^{13}$, quorum respective est numerus 22, 4, 1, 1; quo facto remanent 164, e quibus sunt 16 sive tantum pars *decima*, quorum 10 non fit radix primitiva.

Sed missum facta examinatione, quonam modo agendum sit, ut aut certum aut valde probabile reddatur, numerum a esse radicem pri-

mitivam, revertar ad regulas, quibus tabularum propositarum constructio perficiatur, postquam pro dato ipsius a valore columnae I et II formatae sunt. Et primum formata columna A, quae suppeditat residua minima positiva potestatum $a, a^2 \dots a^n$, quorum postremum est 1, inscribantur residua illa tabulae I iis locis, qui respondent argumentis $n', 2n' \dots p-1$. Quae residua si per $r_n, r_{2n'}, \dots r_{p-1}$ denotamus, vice versa inscribantur numeri $n, 2n', 3n' \dots p-1$ tabulae II iis locis qui respondent argumentis $r_n, r_{2n'}, r_{3n'}, \dots r_{p-1}$. Ita impleti erunt tabulae II loci omnes respondentes argumentis, quae congrua sunt potestati radieis primitivae, cuius exponens per n' divisibilis est. Si habetur $n = p-1$, quem casum antecedentibus consideravi, fit $n' = 1$ omnesque tabulae II loci impleti erunt. Si non habetur $n = p-1$, sit b argumentum tabulae II, cui locus vacuus respondet. Qui numerus b evadit minimus, si eligis argumentum *primum* tabulae II, cui locus tabulae adhuc vacuus respondet. Sit $b \equiv g^m$, agitur de inveniendi indice m seu potius uno ex valoribus quos induere potest. Qui index erit per n' non divisibilis, cum ex hypothesis numerorum $n', 2n', \dots p-1$ tabulae II inscriptorum nullus ad argumentum b pertineat.

Quaerantur residua potestatum $b^2, b^3, \dots$, usque dum perveniatur ad potestatem b^f , quae sit infima, cuius residuo ut argumento tabulae II spectato respondeat locus tabulae iam numero impletus. Numerus f semper est aut n' aut factor ipsius n' . Cum sit $b^f \equiv g^{m'}$, erit etiam f numerus minimus, per quem m multiplicatus producat numerum per n' divisibilem. Sit hic numerus in' , habetur

$$b^f \equiv g^{in'} \pmod{p}.$$

In hac congruentia noti sunt numeri b et f et in' , quorum postremus sumitur e tabula II, in qua respondet residuo ipsius b^f ut argumento. Posito $n' = ff'$, fit

$$b^f \equiv g^{if'} \pmod{p},$$

unde e sequentibus numeris eligendus erit ipsius m valor,

$$m = if', (i+n)f', (i+2n)f', \dots (i+(f-1)n)f'.$$

E quibus reiiciendi sunt numeri $(i+kn)f'$, in quibus $i+kn$ cum f factorem communem habet. Si enim

foret

$$\frac{m}{f'} = i + kn = \mu i', \quad f' = \mu f'',$$

$$b \equiv g^m \equiv g^{\mu f'' \cdot i'}, \quad b' \equiv g^{i' i'},$$

neque igitur, sicuti suppositum est, esset f' valor minimus, pro quo eveniat, ut residuo ipsius b' ut argumento tabulae II spectato respondeat locus tabulae impletus; sed idem iam eveniret pro potestate b' . Reliqui numeri $(i + kn)f''$, in quibus $i + kn$ ad f' primus est, sumi possunt omnes pro ipsius m valoribus; respondent enim alii aliis radicibus primitivis g , pro quibus fieri suppositum est

$$g'' \equiv a \pmod{p}.$$

Quod sequentibus paullo accuratius examinabo.

Radices congruentiae

$$x'' \equiv a \pmod{p}$$

omnes continentur forma $g^{1+\lambda n}$, siquidem g est una quaecunque harum radicum. Si g insuper est radix primitiva, erit etiam $g' \equiv g^{1+\lambda n}$ radix primitiva, si $1 + \lambda n$ ad $p - 1 = nn'$ primus est. Est autem $1 + \lambda n$ ad n primus, ideoque erit $1 + \lambda n$ ad $p - 1$ primus, si insuper $1 + \lambda n$ ad n' primus est. Hinc ut habeatur $g^{i' i'} \equiv a$ simulque sit g' ipsius p radix primitiva, fieri debet $g' \equiv g^{1+\lambda n}$, numero λ e numeris $0, 1, 2 \dots n' - 1$ ita electo, ut $1 + \lambda n$ ad n' primus evadat. Reliquos ipsius λ valores praeter assignatos $0, 1, 2 \dots n' - 1$ considerari non oportet, cum pro aliis iidem ipsius g' valores redeant.

Observo, si A et B inter se primi sint, semper effici posse addendo ipsi A multipulum ipsius B ut prodeat numerus ad alium quemlibet C primus. Sit enim B' factor maximus ipsius C ad B primus sive $\frac{C}{B'}$ factor maximus communis ipsorum B et C ideoque primus ad numeros $A, A + aB$; erit $A + aB$ ad C primus, si ad B' primus est; sub forma autem $A + aB$ pro diversis ipsius a valoribus continentur numeri, qui respectu moduli B' ad B primi residua quaecunque placet relinquunt; unde etiam forma $A + aB$ continet numeros ad B' primos, q. d. e.

Ex antecedentibus fit numerus b congruus potestati $(i + kn)f''^m$ radices primitivae, existente $i + kn$ primo ad f' , unde statuendo radicem illam primitivam $g' \equiv g^{1+\lambda n}$, erit potestas ipsi b congrua huius formae,

$$\begin{aligned} \text{siquidem ponitur} \quad b &\equiv g^{(1+\lambda n)(1+i n)f} \equiv g^{(i+\lambda n)f}, \\ \text{sive} \quad k &\equiv k + i\lambda + k\lambda n \pmod{f}, \\ k - k &\equiv \lambda(i + kn) \pmod{f}. \end{aligned}$$

Cui congruentiae semper per valorem ipsius λ satisfacere licet, cum ex hypothesi sit $i + kn$ ad f primus; et cum sit

$$(1 + \lambda n)(i + kn) \equiv i + k'n \pmod{nf},$$

erit, si etiam $i + k'n$ ad f primus est, numerus quoque $1 + \lambda n$ ad f primus, ideoque etiam ad fn primus, cum sponte pateat, esse $1 + \lambda n$ ad n primum. Numero λ quodcumque multipulum ipsius f addi potest ideoque numero $1 + \lambda n$ multipulum quodcumque ipsius fn ; unde ex observatione antecedente semper dantur ipsius $1 + \lambda n$ valores ad n' primi ideoque etiam primi ad $nn' = p - 1$. Sequitur ex antecedentibus, designantibus k et k' numeros quoslibet, pro quibus numeri $i + kn$ et $i + k'n$ ad f primi fiunt, semper numerum λ idque variis modis ita determinari posse, ut sit

$$(1 + \lambda n)(i + kn)f' \equiv (i + k'n)f' \pmod{p-1},$$

simulque sit $1 + \lambda n$ ad $p - 1$ primus. Unde sequitur, si pro ipsius p radice primitiva g sit $g^x \equiv a \pmod{p}$, designante n' factorem ipsius $p - 1$, et habeatur $b \equiv g^{(i+\lambda n)f} \pmod{p}$, designante f' factorem ipsius n' atque existente $i + k'n$ ad $f = \frac{n'}{f'}$ primo: dato alio valore quocumque k , pro quo et ipso $i + kn$ ad f primus sit, semper aliam extare ipsius p radicem primitivam g' , pro qua sit $g'^x \equiv a \pmod{p}$ atque $b \equiv g'^{(i+\lambda n)f}$. Libera igitur electio est valoris ipsius m e numeris $(i + kn)f'$, pro quibus $i + kn$ ad f primus est; pro eiusmodi enim valore ipsius m quocumque una aut plures extabunt ipsius p radices primitivae g' , pro quibus fiat simul:

$$g'^x \equiv a, \quad g'^m \equiv b \pmod{p}.$$

Q. D. E.

Invento ipsius m valore, designemus residua ipsorum $b, b', b'' \dots b^{f-1}$ minima positiva per $r_n, r_{2n}, r_{3n} \dots r_{(f-1)n}$, quae inscribantur tabulae I iis locis, qui respondent argumentis $m, 2m, 3m \dots (f-1)m$ seu potius residuis eorum minimis positivis secundum modulum $p - 1$. Residuum

[d]

$$r_f, r_{2f}, r_{3f}, \dots r_{nf}.$$

Qui valores tabulae I inscribendi sunt, atque deinde tabulae II apud argumenta $r_f, r_{2f}, r_{3f}, \dots r_{nf}$ inscribendi numeri $f', 2f', 3f' \dots nf'$. Quorum pars iam tabulis inscripta extat.

Est verificatio non negligenda, residui inventi r_f potestatum primae, secundae, $\dots f^m$ esse residua numeros inventos $r_{2f}, r_{3f}, \dots r_{nf}$, quorum postremus est ipse numerus a .

Si $f' = 1$, — et raro secus evenit — iam tabularum constructio absoluta est. Si n' est numerus primus, semper erit $f' = 1$. Si $a = 10$, sequitur e supra apposis, numerorum primorum 365 infra 2500 tantum esse 72, sive pars quinta circiter, pro quibus n' non est numerus primus. Si insuper, quod sine negotio fit, numerum b ita eligis, ut neque residuum quadraticum sit, neque, si n' per 2' divisus impar est, residuum potestatis b' in columna A inveniatur sive inter numeros r_{in} , erit f' semper unitati aequalis, si n' per 2' divisus est numerus primus. Hinc ex. gr., statuto $a = \pm 10$, e tabula apposita numerorum primorum inter 200 et 1000 tantum duos invenis, pro quibus, numero b dicto modo electo, non sit necessario f' unitati aequalis, videlicet 271 et 859, pro quibus est $n' = 54$, $n' = 33$; omnium vero numerorum primorum 365 infra 2500 tantum erunt 11, pro quibus, illa in eligendo b cautione adhibita, f' non sit necessario $= 1$. Et pro his adhuc perquam probabile est, f' ipsi unitati aequalem fore. Ceterum non aliud nanciscimur commodum efficiendo f' unitati aequalem, nisi uniformitatem operationum. Scilicet id tantum discrimen erit, ut idem negotium in plura se dividat, seorsim, sed eadem ratione ac facilitate transigenda.

Quamquam, dicta cautione adhibita, omnibus casibus nisi ab initio, certe post perpaucos tentamina numerus b invenitur, pro quo eruitur $f' = 1$, tamen ut tentaminum omnino locus non sit, paucis addam, quomodo tabularum constructio perficienda sit, si numerus f' ab unitate diversus est. Vocetur B complexus numerorum $r_f, r_{2f}, \dots r_{nf}$, quorum postremus unitati aequalis est. Sit c argumentum minimum vel aliud quodlibet tabulae II, cui locus tabulae vacuus respondet, unde si statuimus

$$c \equiv g' \pmod{p},$$

erit l per f' non divisibilis. Quaerantur residua potestatum ipsius c secundae, tertiae cet. sitque c^f potestas infima, apud cuius residuum ut

[d']

argumentum tabulae II inveniatur locus numero iam impletus. Qui numerus cum esse debeat multiplex ipsius f' — nam alios praeter hos habet tabulae II non inscripsimus — sit

$$c^f \equiv g^{f'} \pmod{p}.$$

Si l ad f' primus est, crit $f'' = f'$; si vero l cum f' factorem communem habet maximum f'' , erit $f'' = \frac{f'}{f''}$ sive $f' = f''f''$. Hinc, ratione praescripta invento numero f'' , innotescit etiam ipsorum l et f' divisor maximus communis $f''' = \frac{f'}{f''}$. E congruentia

$$c^f \equiv g^{f'} \equiv g^{f''} \pmod{p}$$

sequitur, numerum l gaudere forma

$$l = i'f''' + \frac{k(p-1)}{f''} = f'''(i' + k \cdot nf).$$

Porro cum f''' ipsorum l et f' divisor maximus communis sit, sequitur, numeros $\frac{f'}{f''} = f'''$ atque $\frac{l}{f''} = i' + k \cdot nf$ inter se primos esse. Ac vice versa eadem demonstratione, qua supra usus sum, patet, pro valore ipsius l eligi posse quemlibet numerum

$$l = f'''(i' + k \cdot nf),$$

in quo k talis sit integer, pro quo f''' et $i' + k \cdot nf$ inter se primi existunt. Semper enim invenire licet numeros h , pro quibus sit $1 + hnf$ ad f' ideoque ad $p-1$ primus simulque fiat:

$$f'''(1 + hnf)(i' + knf) \equiv f'''(i' + knf) \pmod{p-1},$$

siquidem $i' + knf$ et $i' + knf$ ad f''' primi sunt. Unde facile sequitur, semper dari radices primitivas g et g' tales ut simul habeatur:

$$g^f \equiv g'^f, \quad g^{f''} \equiv g'^{f''}, \quad g^{f'''} \equiv g'^{f'''} \pmod{p}.$$

Quoties igitur radici primitivae g respondet valor $l = f'''(i' + k \cdot nf)$, semper alia extabit radix primitiva $g' \equiv g^{1+hnf}$, pro qua numeri tabulis I et II hactenus inscripti iidem maneant, numerus l autem ex valoribus assignatis $f'''(i' + knf)$ quemlibet datum induat.

Electo aliquo ex iis, quos l induere potest, valoribus, ut obtineantur numeri omnes

$$r_f, r_{2f}, r_{3f}, \dots, r_{p-1},$$

ita agere licet. Supponamus primum, l' esse ad f primum, unde posito

$$l = f^n l',$$

etiam erit $l' = l' + knf$ ad f primus. Quaerantur eo casu residua potestatum

$$c, c^2, c^3, \dots c^{f^n},$$

sive numeri

$$r_{f^n}, r_{2f^n}, r_{3f^n}, \dots r_{nf^n},$$

e quibus habentur residua potestatum $c, c^2 \dots c^{f^n}$ sive numeri $r_{f^n}, r_{2f^n}, \dots r_{nf^n}$, porro numeri $r_{f^n}, r_{2f^n}, \dots r_{nf^n}$ iam tabulae I inscripti. Inventis residuis illis, per continuam columnarum I et II applicationem ex iis derivas numeros omnes huiusmodi

$$r_{kf^n + \lambda n} = r_{\lambda n};$$

in quo numeri k valores omnes $1, 2, 3 \dots f^n$ atque numeri λ valores omnes $0, 1, 2 \dots n-1$ induere possunt. Cum sit l' ad f^n primus atque insuper suppositum sit esse l' ad f primum, erit l' ad ff^n primus. Unde facile patet, numeros

$$\lambda = kl' + k'ff^n$$

respectu moduli nff^n congruos fore omnibus numeris

$$1, 2, 3 \dots nff^n.$$

Nam respectu moduli ff^n complexus numerorum kl' convenit cum complexu ipsorum k , quia l' ad ff^n primus est; complexus autem numerorum $k'ff^n$ respectu moduli nff^n non mutatur, si omnibus idem multipulum ipsius ff^n additur; unde complexus numerorum λ respectu moduli nff^n congruus erit complexui numerorum

$$k + k'ff^n,$$

qui idem est atque complexus numerorum $1, 2, 3 \dots nff^n$. Quoniam numeri λ respectu moduli nff^n cum numeris $1, 2, 3 \dots nff^n$ conveniunt, etiam numeri λf^n respectu moduli $p-1$ cum numeris

$$f^n, 2f^n, 3f^n, \dots p-1$$

conveniunt; unde residua $r_{\lambda f^n}$ sunt ipsa

$$r_f, r_{2f}, r_{3f}, \dots r_{p-1},$$

quae indagatu proposita erant.

Aliter agendum erit, si i' ideoque etiam l' ad f primus non est; quippe quo casu numeri λ omnes eodem factore affecti erunt, qui ipsis i' et f communis est. Nisi eo casu praeferatur, alium eligere numerum c , pro quo i' ad f primus evadat, multiplicentur residua iam inventa potestatum

$$c, c^2, \dots c^{f'}$$

sive numeri

$$r_{cf}, r_{2cf}, \dots r_{cf'}$$

singuli per singulos numeros iam tabulae I inscriptos

$$r_f, r_{2f}, \dots r_n,$$

et productorum quaerantur residua. Quae residua omnia repraesentari possunt hac forma

$$r_{k/f + k'f'},$$

in qua ipsi k valores $1, 2 \dots f''$ atque ipsi k' valores $1, 2 \dots f$ conveniunt. Posito

$$\mu = kf + k'f',$$

residua illa fiunt $r_{\mu/f'}$, et cum sit l' ad f'' primus, per methodum modo adhibitam patet, numeros μ respectu moduli $f''f$ fore omnibus

$$1, 2, 3 \dots ff''$$

congruos, unde etiam numeri $\mu f'''$ respectu moduli n' omnibus kf''' sive omnibus

$$f''', 2f''', 3f''' \dots n'$$

congrui erunt. E singulis deinde $r_{\mu/f'}$, applicatione columnarum I et II facta, derivantur numeri

$$r_{\mu/f' + f''},$$

in qua expressione k'' valores $0, 1, 2 \dots n-1$ induere potest; complexus autem numerorum $k''n'$ respectu moduli $nn' = p-1$ non mutatur, si omnibus idem additur multipulum ipsius n' ; unde numeri $r_{\mu/f' + f''}$ conveniunt cum numeris $r_{f' + f''}, r_{2f' + f''}, \dots r_{n' + f''}$, qui sunt iidem atque numeri

$$r_{f''}, r_{2f''}, r_{3f''}, \dots, r_{p-1f''}$$

qui indagatu propositi erant. Prior methodus, quae tamen soli casui applicari potest, quo t' ad f primus est, paullo expeditior erit; nam cum numerum c semper liceat valde exiguum accipere, facilius inveniuntur residua potestatum ipsius c usque ad ff''^{p-1} atque totidem productorum, quae posteriore methodo requiruntur.

Ex inventis numeris $r_{f''}, r_{2f''}$ cet. ii, qui nondum in tab. I habentur, tabulae illi inscribantur iis locis, qui respective argumentis f'' , $2f''$ cet. respondent; ac deinde e numeris f'' , $2f''$ cet. ii qui nondum in tabula II habentur, ei tabulae inscribantur iis locis, qui respective argumentis $r_{f''}, r_{2f''}$ cet. respondent. Quorum numerorum in singulis tabulis iam pars f''^{p-1} invenitur. Ac si $f'' = 1$, quod longe plurimis casibus eveniet, praesertim si in eligendo c certa cautione uteris, tabularum constructio iam absoluta est. Si vero nondum habetur $f'' = 1$, praecedentia satis superque docent, quomodo in absolvendo negotio pergendum sit. Omnibus vero casibus totus computus subducendus consistet in n' multiplicationibus binorum numerorum ipso p minorum totidemque divisionibus per ipsum p ; reliqua omnia per columnas I et II absolvuntur.

His fere methodis tabulae pro singulis numeris primis inter 200 et 1000 calculatae sunt; pro reliquis enim infra 200 tabulas a Cl. *Ostrogradski* editas repetere satis habui. Ubique suppositum est $a = 10$, formata columna I decrescente, quoties p formae $4m + 3$ atque 10 ipsius p residuum quadraticum erat, hoc est pro numeris primis p formarum $40m - 1$, $+3$, -9 , -13 . Hinc enim nascimur ipsius n' valorem dimidio minorem. Excepi tantum ipsius p valores,

$$239. \quad 271. \quad 449. \quad 641. \quad 757. \quad 859,$$

pro quibus n' paullo maiores valores induit,

$$17. \quad 27. \quad 14. \quad 20. \quad 14. \quad 33.$$

Quibus casibus ad maiorem operationum uniformitatem circumspexi radices primitivas, quae mox inventae erant minimae,

$$-2. \quad -2. \quad 3. \quad 3. \quad 2. \quad 2,$$

quas bases tabularum accepi. Quamquam ambigi possit de commodo illius uniformitatis operationum, quae maxima est, si inde ab initio a radice primitiva explorata proficisceris. Nam cum verificationes numerorum fre-

qucentissimae maxime commendandae sint, fit, si pro maioribus ipsius *n'* valoribus totum negotium, sicuti antecedentibus vidimus, in plura subdividitur, ut totidem sponte se offerant verificationes, quae si errorem commissum arguant, tantum pars exigua calculi repetenda erit. Fieri etiam potest, ut calculatori firmo et exercitato molestior sit continuus ille transitus ex altera columnarum I et II ad alteram, quam faciles multiplicationes et divisiones, quae ad residua potestatum successivarum formanda requiruntur. Sed in his rebus alius aliam viam praeferre potest; ego hic eam exponere volui, qua tabulae reapse calculatae sunt. Quae ab omnibus tentaminibus libera est atque nullum aut fere nullum multiplicationis aut divisionis aut subtractionis aut additionis negotium poscit, sed tota fere innititur continua illa columnarum I et II applicatione, quarum et formatio et applicatio nil est nisi datorum numerorum secundum simplicissimam regulam dispositio. Qua de re fieri potuit, ut homo accuratus, subcenturio ballistarius (*Kanonier-Unteroffizier*), nomine *Kraemer*, qui post stipendia merita scribae vicibus passim fungebatur, ad hanc tabularum confectionem instructus, optime et brevi tempore totum negotium absolveret.

Lubenter fateor, mihi *Burckhardiano* labore initio huius Introductionis exhibito, qui viro praestantissimo tantum ad paginam implendam inserviebat, ad constructionem tabularum, quas iam in publicum edo, animum factum esse. Nam quod a conficiendis tabulis maxime detertere potuisset negotium ut prolixum et incertum, praecursoria indagatio radices primitivae, quae methodis vulgo notis ante omnia postulabatur, id *Burckhardiana* tabula maiorem partem absolutum erat, quippe quae numeros primos plurimos assignat, quorum numerus commodissimus ± 10 radix primitiva est. Postea quidem intellexi, per methodum generalem hic traditam praecursoria illa indagatione omnino superscderi, quippe secundum quam numeri tabulae construendae caleulari possunt ante radicem primitivam cognitam, quae in ipso calculo inter numeros illos se sponte offert. Nihil tamen minus tabulae *Burckhardianae* etiam in methodo generali hic proposita usus non contemnendus est, quia eius beneficio pro singulis numeris primis, qui limites illius tabulae non egrediuntur, inde ab initio praevidere licet, an tabula I una eademque operatione confici possit, an construendae eius negotium in plura et in quot dividatur. Qua de re *Burckhardianam* tabulam, ex eo quo latebat loco protractam, hic repetitam

dedi, utiis usui esse possit, quibus forte mens est, huic operi adiciere tabulas pro numeris primis inter 1000 et 2500. Quas si quis vel pro omnibus numeris primis infra 10000 construere susciperet, non tantus foret labor, sed obstaret publicationi ambitus operis. Cui incommodo ex parte aliqua obvenitur, si tabulas similes condidit earum quas pro numeris primis infra 100 ill. Gauss in *Disquisitionibus Arithmeticis* dedit. Quae tabulae pro singulis modulis primis exhibent solum numerorum *primorum*, modulis inferiorum, indices; quippe e quibus cuilibet dati numeri indicem simplicibus additionibus eruis. Quo compendio tabulae II ad multo minorem ambitum reducuntur, tabulae I autem omnino non conducunt. Eiusmodi tabulae, licet minus commodae, ad multos tamen usus sufficiunt, ex. gr. si explorandum proponitur, an datus numerus sit numeri primi residuum cubicum, biquadraticum cet. Cum eo consilio tabulae I omnino non construantur, addam methodum expeditam, qua *tabulam indicum immediate conficere licet, siquidem radix primitiva cognita est.*

Sit a radix primitiva formenturque ut supra iuxta positae columnae I et II, quarum I est series numerorum naturalium atque II eorum ^{arithmeticorum} residua minima positiva suppeditat. Vocemus a , residuum minimum positivum ipsius an , ita ut apud numerum n columnae I inveniat in columna II numerus a . Formetur iam columna III *a zero* incipiens et secundum hanc legem continuata, ut iuxta positus in coll. I, II, III numeris n , a , m scribatur numerus proxime maior $m+1$ in columna III iuxta columnae I numerum a . Hac ratione numeri $0, 1, 2 \dots p-2$ locis praescriptis columnae III inscribantur, eruntque illi numeri indices numerorum iuxta positorum columnae I. Ac fortasse expeditissimum erit, hac ratione tabulas residuorum et tabulas indicum a se independenter construere, neque has ex illis formare, uti supra proposui. Nam ista, qua opus erat, commutatio valorum tabularium in argumenta et argumentorum in valores tabulares perquam molesta est et molestissima correctio lapsuum calami qui ea in re vix evitantur. Ceterum etiam nulla cognita radice primitiva methodus praecedens applicari potest, factis, quae e supra traditis sine negotio se offerunt, mutationibus.

Ad finem adieci tabulas ad modulos pertinentes ipso 1000 inferiores, qui *numerorum primorum potestates* sunt. Designante enim n numerum primum imparem, notum est, etiam respectu moduli n^* residua omnia

[e]

per n non divisibilia repraesentari posse per eiusdem numeri potestates, qui numerus *ipsius* n^{a} *radix primitiva* dicitur. Cuius rei pro modulis e potestatibus numerorum primorum *diversorum* compositis analogon non datur. Sunt infra 1000 numeri primorum imparium potestates sequentes *septendecim*:

$$\begin{array}{ccccccc} 9 = 3^2, & 25 = 5^2, & 27 = 3^3, & 49 = 7^2, & 81 = 3^4, & 121 = 11^2, \\ 125 = 5^3, & 169 = 13^2, & 243 = 3^5, & 289 = 17^2, & 343 = 7^3, & 361 = 19^2, \\ 529 = 23^2, & 625 = 5^4, & 729 = 3^6, & 841 = 29^2, & 961 = 31^2. \end{array}$$

Sequitur ex iis, quae adnotavi in *Diario Crelliano* Vol. I. p. 301, designante n numeros 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, radicem primitivam ipsius n quamlibet, ipso n minorem, esse etiam ipsius n^{a} radicem primitivam, exceptis solis 14 pro 29^{a} atque 18 pro 37^{a} . Dedi enim l. c. e calculis cl. Astronomi *Busch* pro singulis ipsius n valoribus assignatis radices omnes congruentiae

$$x^{n-1} \equiv 1 \pmod{n^{\text{a}}},$$

et facile patet, *ipsius* n *radicem primitivam*, quae inter radices illas non *invenitur*, eandem ipsius n^{a} *radicem primitivam* esse. Pro singulis autem n radices eius congruentiae minores ipso n l. c. non inventae sunt, nisi $x = 3$, $x = 9$ pro $n = 11$, porro $x = 14$ pro $n = 29$, $x = 18$ pro $n = 37$; pro modulo 11 autem numeri 3, 9 radices primitivae non sunt. Unde, solis exceptis 14 pro $n = 29$ atque 18 pro $n = 37$, radices ipsius n primitivae, ipso n minores, etiam ipsius n^{a} radices primitivae erunt, siquidem n valorem 37 non superat. Modulorum primorum

$$3, 5, 7, 11, 13, 17, 19, 23, 29, 31,$$

qui soli in usum vocantur, si numeri n^{a} infra 1000 consistere debent, sunt radices primitivae minimae,

$$2, 2, 3, 2, 2, 3, 2, 5, 2, 3,$$

quae ex antecedentibus erunt etiam radices primitivae quadratorum illorum modulorum. Porro est 10 radix primitiva ipsorum 7, 17, 19, 23, 29 ideoque ex antecedentibus etiam ipsorum 7^{a} , 17^{a} , 13^{a} , 23^{a} , 29^{a} . Iam designante n numerum primum imparem quemlibet, probari potest, *radicem primitivam quamcumque ipsius* n^{a} *eandem esse radicem primitivam cuiuslibet potestatis*

ipsius n . Unde habentur ex antecedentibus etiam radices primitivae reliquorum modulorum

$$3^1, 3^2, 3^3, 3^4, 5^1, 5^2, 7^1,$$

per quibus nobis tabulae construendae sunt.

Propositio allata, radicem ipsius n^a primitivam quamcunque cuiuslibet etiam altioris potestatis ipsius n radicem primitivam esse, sic probatur. Est a radix primitiva ipsius n^a , si nulla potestas ipsius a inferior quam $n^{a-1}(n-1)^a$ per n^a divisa residuum $+1$ relinquit. Quod facile probatur locum habere, si a sit radix primitiva ipsius n neque ipsius a potestas $n^{a-1}(n-1)^a$ per n^a divisa residuum 1 relinquat. Posito autem

$$a^{n-1} \equiv 1 + fn \pmod{n^a},$$

erit f numerus per n non divisibilis, quoties numerus a est ipsius n^a radix primitiva. Unde sequitur, numerum

$$\begin{aligned} a^{(n-1)n^{a-1}} &= (1+fn)^{n^{a-1}} \\ &= 1 + fn^{a-1} + \frac{n^{a-1}-1}{2} f^2 n^a + \dots \end{aligned}$$

per n^a divisum non relinquere residuum $+1$, q. d. e.

Potestate binomii ulterius evoluta, omnes terminos tertium insequentes per n^a divisibiles evadere, uti ipsum tertium, sic constat. Sit n^a potestas summa numeri primi n , per quam divisibile sit productum $1.2.3\dots A$, ac sit A sive ipsi n^a aequalis sive inter n^a et n^{a+1} ; invenitur

$$a = \left(\frac{A}{n}\right) + \left(\frac{A}{n^2}\right) + \left(\frac{A}{n^3}\right) + \dots + \left(\frac{A}{n^a}\right),$$

siquidem $\left(\frac{A}{N}\right)$ est numerus integer ipsi $\frac{A}{N}$ aequalis sive, quoties $\frac{A}{N}$ est fractio, ipso $\frac{A}{N}$ proxime minor. Unde erit

$$a < \frac{A}{n} \left\{ 1 + \frac{1}{n} + \frac{1}{n^2} + \text{etc. in infin.} \right\}$$

sive

$$a < \frac{A}{n-1}.$$

Sit n^3 summa potestas ipsius n per quam productum

$$p(p-1)(p-2)\dots(p-A+1)$$

dividi possit, erit numerus integer

[c*]

$$\frac{p(p-1)(p-2)\dots(p-A+1)}{1 \cdot 2 \cdot 3 \dots A} \cdot n^A$$

divisibilis per

$$n^{A-\alpha+\beta},$$

ubi

$$A - \alpha + \beta > \frac{(n-1)}{n} A + \beta.$$

Habetur autem

$$\left(\frac{n-1}{n}\right) A = 2 + \frac{(A-2)(n-3) + 2(A-3)}{n},$$

ideoque, si $n \geq 3$, $A \geq 3$, fit $A - \alpha + \beta > \beta + 2$. Casu antecedente ponendum est $p = n^{\mu-2}$ ideoque fit $\beta \geq \mu - 2$, $A - \alpha + \beta > \mu$. Unde si, quod statuimus, habetur

$$p = n^{\mu-2}, \quad A \geq 3, \quad n \geq 3,$$

fit numerus

$$\frac{n^{\mu-2}(n^{\mu-2}-1)\dots(n^{\mu-2}-A+1)}{1 \cdot 2 \cdot 3 \dots A} n^A,$$

per potestatem ipsius n altiore quam μ^{um} ideoque etiam per ipsam μ^{um} divisibilis. Numerus ille autem in f^A ductus est terminus $A+1^{\text{um}}$ evolutionis potestatis propositae,

$$(1 + fn)^{n^{\mu-2}},$$

unde termini evolutionis tertium insequentes erunt per n^{μ} divisibiles, q. d. e.

Addam adhuc eiusdem propositionis hanc demonstrationem. Si numerus est radix primitiva moduli n^{μ} , ubi $\mu > 2$, sane idem erit radix primitiva moduli n^{μ} . Unde radices primitivae moduli n^{μ} positivae modulo minores omnes inveniri debent inter numeros $g + in^{\mu}$, siquidem pro numero g sumuntur omnes ipsius n^{μ} radices primitivae positivae ipso n^{μ} minores atque numero i tribuuntur $n^{\mu-2}$ valores, 0, 1, 2, 3, ..., $n^{\mu-2} - 1$. Habentur autem radices primitivae ipsius n^{μ} positivae ipso n^{μ} minores tot quot sunt numeri positivi ad $n^{\mu-1}(n-1)$ primi et ipso $n^{\mu-1}(n-1)$ minores. Iam si habentur h numeri positivi ad $n-1$ primi et ipso $n-1$ minores, habentur

$$n^{\mu-2}(n-1)h$$

numeri positivi ad $n^{\mu-1}(n-1)$ primi et ipso $n^{\mu-1}(n-1)$ minores. Unde ipsius n^{μ} radices primitivae positivae modulo minores habentur

$$n^{\mu-2}(n-1)h,$$

ipsius n^i habentur

$$(n-1)h.$$

Itaque numerus g valores $(n-1)h$ induit, unde, cum numerus i valores n^{n-1} induat, erunt ipsius $g+in^i$ valores

$$n^{n-1}(n-1)h.$$

Cum radices primitivae ipsius n^n positivae ipso n^n minores contineantur omnes sub forma $g+in^i$ atque ex antecedentibus eodem numero sint atque valores huius expressionis $g+in^i$, sequitur, vice versa expressionis $g+in^i$ valores omnes esse ipsius n^n radices primitivas positivas ipso n^n minores. Unde omnes ipsius n^n radices primitivae etiam ipsius n^n radices primitivae erunt, q. d. e.

Postremo adieci tabulas pro modulis 2^n ipso 1000 minoribus. Quorum modularum theoriam egregie exposuit ill. Gauss in *Disquis. Arithm.* (Sect. I. pg. 88. 89.) In qua Sectione etiam reliqua invenis, quae in hac Introductione ut nota supponuntur. Numerorum imparium quadrata cum forma $8n+1$ gaudeant, sequitur numerorum formae $8h+1$, $8h+3$, $8h+5$, $8h+7$ potestates impares suas respective formas non mutare. Unde, si $\mu \geq 3$, fieri non potest, ut numeri impares omnes potestatibus unius numeri respectu moduli 2^n congrui sint. Adnotavit ill. Gauss, si $\mu \geq 3$, $m \geq 2$ atque k quicunque impar numerus sit, cuiuslibet propositi numeri imparis

$$N = 2^n k \pm 1,$$

potestatem $2^{n-\mu}$ neque inferiorem per 2^n divisam residuum ± 1 relinquere. Erit enim

$$N^{\mu} = 2^{n\mu} k^{\mu} \pm 1 = 2^{n\mu} k' + 1,$$

designante k' imparem, eodemque modo aliae ex aliis inveniuntur aequationes,

$$N^k = 2^{nk} k'' + 1$$

$$N^s = 2^{ns} k''' + 1$$

$$\dots\dots\dots$$

$$N^{2^{n-\mu}} = 2^{n(2^{n-\mu})} k^{(2^{n-\mu})} + 1,$$

designantibus k'' , k''' etc. impares. Porro, si i est impar quicunque $= 2i'+1$, fit ex antecedentibus:

$$N^{2^n i} = N^{2^n} \cdot N^{2^{n+1} i} \\ = \{1 + 2^{n+\alpha} k^{(n)}\} \{1 + 2^{n+\alpha+1} k^{(n+1)}\}''',$$

unde habetur:

$$N^{2^n i} \equiv 1 + 2^{n+\alpha} k^{(n)} \pmod{2^{n+\alpha+1}},$$

qua in formula est $k^{(n)}$ impar. Unde sequitur, infimam ipsius N potestatem, unitati congruam respectu moduli 2^n , obtineri ponendo

$$i = 1, \quad \alpha = \mu - m,$$

q. d. e. Ceterum ex his patet, potestates ipsius N usque ad $2^{n-\mu}$ residua inter se diversa relinquare; nam si harum potestatum residua inter se congrua existerent, deduceretur ipsius N potestas inferior quam $2^{n-\mu}$, quae per 2^n divisa residuum $+1$ relinqueret.

Sequitur ex antecedentibus, obtineri numeros impares, quorum potestates per 2^n divisae maximum residuorum inter se diversorum numerum relinquant, ponendo

$$m = 2,$$

cumque numerum residuorum diversorum esse 2^{n-2} . Numeri $N = 2^k + 1$ posito $m = 2$ formam induunt $4k \pm 1$, designante k imparem, sive posito $k = 2h + 1$, formas $8h + 3$, $8h + 5$. Residua igitur potestatis primae, secundae etc. 2^{n-2} numeri $8h + 3$, quae omnia sunt formarum $8h' + 3$, $8h' + 5$ et quorum numerus est 2^{n-2} , omnia inter se diversa sunt. At residua diversa formae $8h' + 3$, $8h' + 5$ respectu moduli 2^n eodem numero sunt

$$2^{n-2} = \frac{1}{4} \cdot 2^n;$$

unde, si $\mu \geq 3$, respectu moduli 2^n residua omnia formae $8h' + 3$, $8h' + 5$ sunt congrua potestatibus cuiuscunque numeri $8h + 3$. Eodem modo sunt residua omnia formae $8h' + 3$, $8h' + 5$ congrua potestatibus cuiuscunque numeri $8h + 5$.

Ad tabulas construendas elegi pro *basi* numerum $8h' + 3$ ex iisque minimum 3. Cum numeri $-(8h' + 5)$, $-(8h' + 7)$ et ipsi formis gaudeant $8h' + 3$, $8h' + 5$, sequitur ex antecedentibus, designante N imparem *quemcunque*, aut $+N$ aut $-N$ respectu moduli 2^n potestati ipsius 3 congruum fieri. Signum ita determinandum est, ut habeatur

$$\pm N \equiv \text{aut } 3 \text{ aut } 1 \pmod{8},$$

sive, numero N semper positive sumto ac designante I indicis ipsius N valorem tabularem, statuendum erit:

$$(-1)^{\frac{(N-1)(N-3)}{8}} N \equiv 3' \pmod{2^n}.$$

Si alium numerum $sh+3$ pro basi accipere placet, sumatur e tabula eius index K , qui impar erit. Pro quo habetur

$$sh+3 \equiv 3^x \pmod{2^n},$$

eritque

$$(-1)^{\frac{(N-1)(N-3)}{8}} N \equiv (sh+3)^{x'} \pmod{2^n},$$

si index I' determinatur per congruentiam:

$$KI' \equiv I \pmod{2^{n-2}}.$$

Sit $2'$ summa ipsius 2 potestas, per quam numerus I divisibilis est, per eandem neque altiolem etiam I' divisibilis erit, atque habetur:

$$K \cdot \frac{I'}{2'} \equiv \frac{I}{2'} \pmod{2^{n-2-2'}}.$$

Datis numeris imparibus K , $\frac{I}{2'}$, e tabula, quae ad modulum $2^{n-2-2'}$ pertinet, obtinetur numerus $\frac{I'}{2'}$ congruentiae antecedenti satisfaciens, unde etiam habetur numerus quaesitus I' .

Si pro basi accipitur numerus $sh+5$ atque quaeritur numerus I' satisfaciens congruentiae

$$(-1)^{\frac{(N-1)(N-5)}{4}} N \equiv (sh+5)^{x'} \pmod{2^n},$$

ita agendum est. Sumantur e tabulis indices I , K , satisfaciens congruentiis,

$$(-1)^{\frac{(N-1)(N-3)}{8}} N \equiv 3', \quad -(sh+5) \equiv 3^x \pmod{2^n},$$

quorum K semper impar erit. Fit

$$(-1)^{\frac{(N-1)(N-5)}{4}} N \equiv (sh+5)^{x'x} \pmod{2^n},$$

ideoque

$$IK \equiv I \pmod{2^{n-2}}.$$

Si z' est summa ipsius z potestas numerum I metiens, determinatur per tabulas nostras e congruentia

$$\frac{I'}{z'} \cdot K \equiv \frac{I}{z'} \pmod{z^{n-1-z}},$$

numerus $\frac{I'}{z'}$, unde etiam ipsius I' valor habetur.

Pro singulis modulis z^n residua imparia N in tabulis constructis omnia inveniuntur minora ipso z^{n-1} , eorum igitur numerus est $\frac{z^n}{4}$; si proponitur residuum inter z^{n-1} et z^n positum, id a modulo z^n detrahendum est.

Pro modulis primorum potestatibus tabulas confecit Dominus *Wichert*, muneris scholastici candidatus. De adoratione tabularum nihil monendum est, nisi quod in margine *denarii*, in facie *unitates* positae sunt. Cura et benevolentia virorum Clarissimorum, Professorum *Dirichlet*, *Dove*, *Steiner*, *Mädler*, Doctorum *Wolfers*, *Breniker*, *Galle* factum est, ut tanta numerorum moles ab omnibus mendis cum typothetae tum scribe purgaretur, quorum larga copia ad calcem adiecta est. Si quod tamen mendum praeter expectationem sollertem inquisitionem fugisse reprehenderetur, id cum *Academia Litterarum* communicetur rogamus. Maximas autem gratias ago illustrissimo *Encke*, qui et his emendatricibus curis praesidere et summo studio ac benevolentia me egregiis consiliis in adornando opere adiuvare voluit.

Scr. Regimontii d. 4. Ianuarii 1839.

## TABULA RERUM.

~~~~~

| | |
|--|-----------|
| Introductio | Pag. 1. |
| Tabulae numerorum ad indices datos pertinentium et indicum numero dato correspondentium pro modulis primis minoribus quam 1000 | Pag. 1. |
| Tabulae residuorum et indicum, sibi mutuo respondentium, pro modulis minoribus quam 1000, qui sunt numerorum primorum potestates | Pag. 222. |
| Huius tabulae ea pars quae pertinet ad modulus formae 2^n , invenitur | Pag. 239. |
